

Global X Russell 2000 Covered Call ETF (RYLD)

Global X Russell 2000 Covered Call ETF (RYLD)

RYLD follows a “covered call” or “buy-write” strategy. The Fund purchases the Global X Russell 2000 ETF and/or the stocks in the Russell 2000 Index, and “writes” or “sells” corresponding call options on the Russell 2000 Index.

High Income Potential

RYLD seeks to generate income through covered call writing, which historically produces higher yields in periods of volatility.¹

Monthly Distributions

RYLD has made monthly distributions 5 years running.

Efficient Options Execution

RYLD writes call options on the Russell 2000 Index, saving investors the time and potential expense of doing so individually.

Covered Call Strategy Summary

A covered call is an option strategy in which an investor writes (sells) a call option on an asset he/she already owns

Covered call strategy payoff

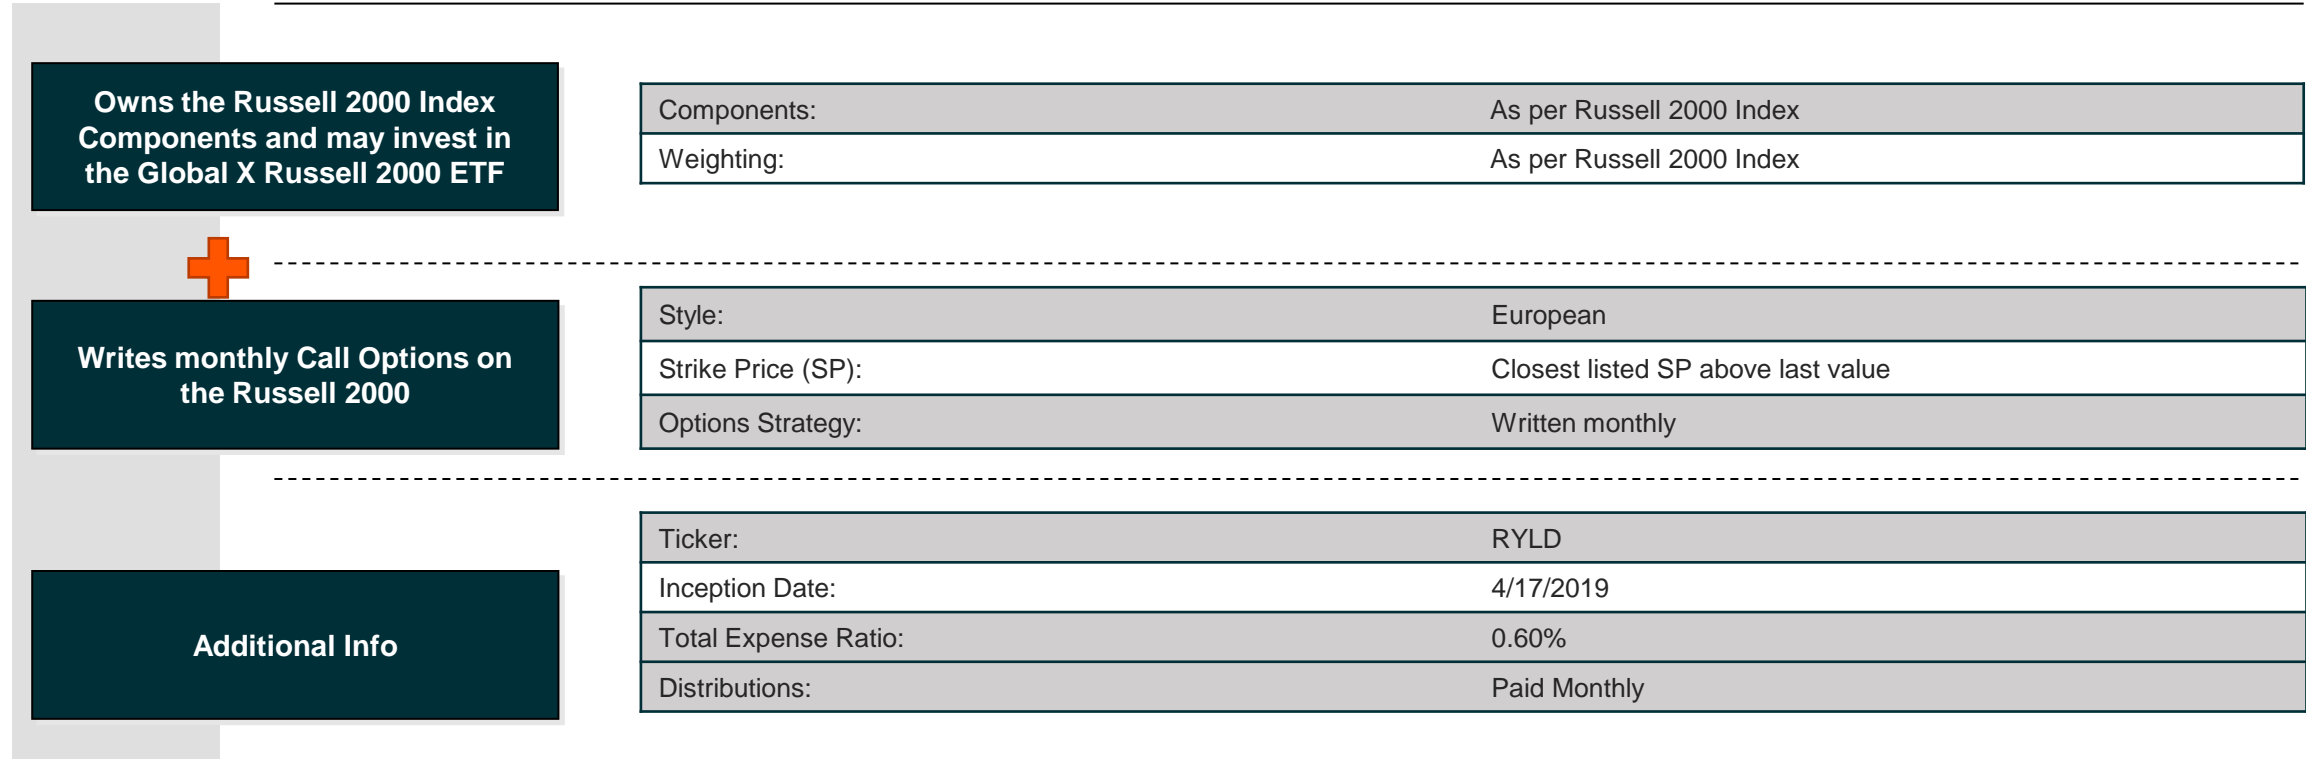

Covered Call Features

- Generates option premium and potential income in exchange for upside potential. The upside is capped in the event that the stock appreciates beyond the strike price.
- Option premiums tend to increase during volatile markets, offering a potential risk management component.
- No additional downside protection beyond the premiums received.

How This Works: Covered Call Strategy In Practice (RYLD)

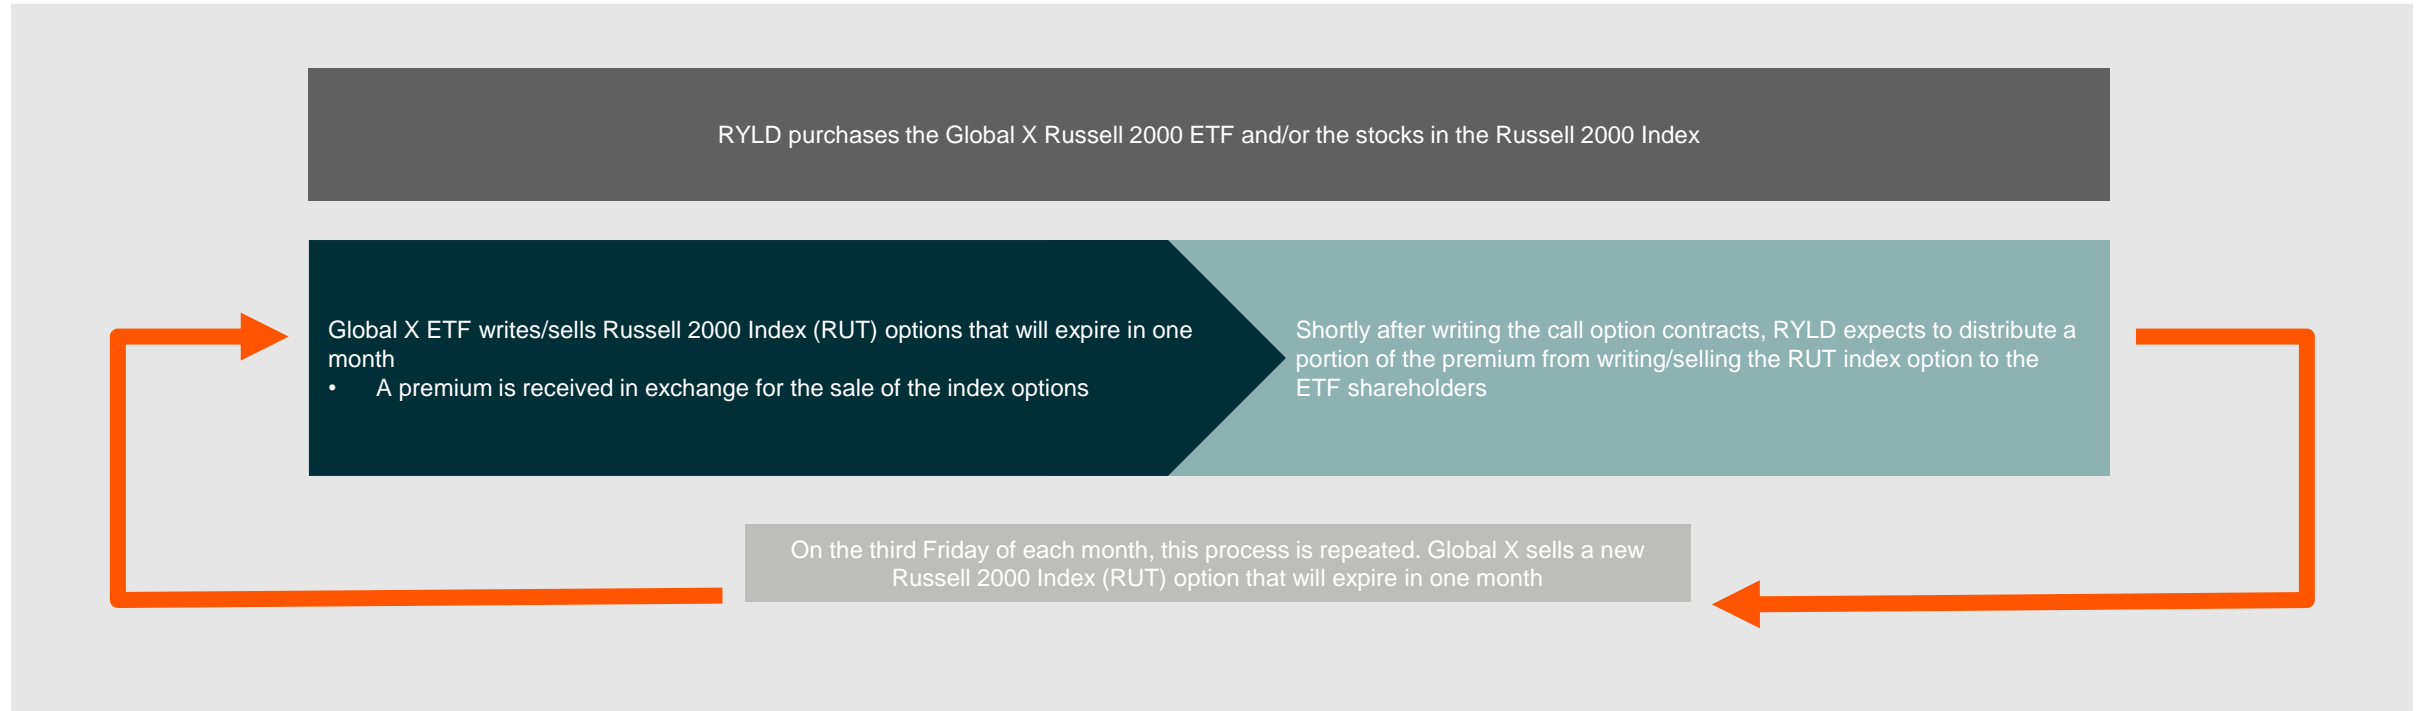

RYLD is an ETF that implements a covered call strategy on the Russell 2000.

The Global X Russell 2000 Covered Call ETF (RYLD) seeks to provide investment results that correspond generally to the price and yield performance, before fees and expenses, of the Cboe Russell 2000 BuyWrite Index.

Covered Call Process Explained

Illustrating how an ETF can implement a covered call strategy, the Global X Russell 2000 Covered Call ETF (RYLD) maintains exposure to the stocks in the Russell 2000, while writing call options on the index each month.

Index Options Details:

- Cannot be called/exercised early
- Settlement is in Cash

Global X Covered Call ETFs: How it Works (with premiums)

Assuming a 2% premium is received, we can visualize how Global X's Covered Call ETFs are expected to perform.

For Illustrative Purposes Only to demonstrate mathematical principal. This is not a guarantee of future results. Covered call Strategy does not reflect fund fees, which would further reduce returns. Fund market price returns may vary from NAV total returns.

Covered Call Performance Scenarios

Covered call would be expected to **underperform** since its potential gain will be limited to the premiums received.

Covered call would be expected to **outperform** if the reference index price at contract initiation ends at the same price upon contract expiration since its performance will be supported by the premium income collected from selling monthly index calls.

Covered call would be expected to **outperform** if the reference index falls throughout the life of the options contract due to the covered calls potentially offsetting some losses.

For illustrative purposes only. Flat/Choppy market assumes no fluctuations below the strike price.

Investment Case for RYLD

What can an income-oriented investor potentially do to increase their portfolio's yield?

- A** Take more duration or credit risk in the bond markets, like high yield and Emerging Market bonds
- B** Look for alternative sources of income, such as high dividend stocks, MLPs, Real Estate Investment Trusts (REITs) or preferred.
- C** Consider an options-based, premium-generating strategy, such as **the Global X Russell 2000 Covered Call ETF (RYLD)**

The Global X Russell 2000 Covered Call ETF (RYLD) follows a “covered call” or “buy-write” strategy, in which the fund purchases the Global X Russell 2000 ETF and/or the stocks in the Russell 2000 Index and “writes” or “sells” corresponding call options on the Russell 2000 Index.

A portion of the distribution is estimated to include a return of capital. For information on the breakdown of the most recent distribution, please see the [19a notice](#). These do not imply rates for any future distributions.

Implied Volatility, A Key Determinant of Option Premiums

The monthly distribution of RYLD is capped at the lower of: a) half the premiums received, and b) 1% of the net asset value (NAV). The excess of options premiums received, if applicable, is reinvested into the fund.

Percent calculations use the Fund NAV as of the ex-date. Implied Volatility is being measured by RVX, Cboe Russell 2000 Volatility IndexSM.

Small-Caps May Offer Equity Income Portfolio Diversification

Equity income portfolios have historically utilized large or mid-cap dividend strategies because they tend to exhibit less volatility. A covered call overlay on a small-cap index could potentially address this concern and allow for diversification.

RYLD During Drawdowns¹

A covered call ETF offers the potential to outperform their equity indices during steep and gentle market declines. This is due to the short call component providing a level of downside risk mitigation.

Global X Russell 2000 Covered Call ETF (RYLD): Important Information & Risks

Investing involves risk, including the possible loss of principal. Concentration in a particular industry or sector will subject RYLD to loss due to adverse occurrences that may affect that industry or sector. Investors in RYLD should be willing to accept a high degree of volatility in the price of the fund's shares and the possibility of significant losses.

RYLD engages in options trading. An option is a contract sold by one party to another that gives the buyer the right, but not the obligation, to buy (call) or sell (put) a stock at an agreed upon price within a certain period or on a specific date. A covered call option involves holding a long position in a particular asset, in this case U.S. common equities, and writing a call option on that same asset with the goal of realizing additional income from the option premium. RYLD writes covered call index options on the Russell 2000 Index. By selling covered call options, the fund limits its opportunity to profit from an increase in the price of the underlying index above the exercise price, but continues to bear the risk of a decline in the index. A liquid market may not exist for options held by the fund. While the fund receives premiums for writing the call options, the price it realizes from the exercise of an option could be substantially below the indices current market price.

Shares of ETFs are bought and sold at market price (not NAV) and are not individually redeemed from the Fund. Brokerage commissions will reduce returns. Beginning October 15, 2020, market price returns are based on the official closing price of an ETF share or, if the official closing price isn't available, the midpoint between the national best bid and national best offer ("NBBO") as of the time the ETF calculates current NAV per share. Prior to October 15, 2020, market price returns were based on the midpoint between the Bid and Ask price. NAVs are calculated using prices as of 4:00 PM Eastern Time. The returns shown do not represent the returns you would receive if you traded shares at other times. Indices are unmanaged and do not include the effect of fees, expenses or sales charges. One cannot invest directly in an index.

Bonds and bond funds will decrease in value as interest rates rise. High yield bonds involve greater risks of default or downgrade and are more volatile than investment grade securities, due to the speculative nature of their investments. Emerging markets involve heightened risks related to the same factors as well as increased volatility and lower trading volume. Real estate and REIT investments are subject to changes in economic conditions, credit risk and interest rate fluctuations. Preferred stock is subject to many of the risks associated with debt securities, including interest rate risk. Companies may not pay a dividend, an issuer may suspend payment of dividends at any time, and in certain situations an issuer may call or redeem its preferred stock or convert it to common stock. Investments in securities of MLPs involve risk that differ from investments in common stock including risks related to limited control and limited rights to vote on matters affecting the MLP. MLP common units and other equity securities can be affected by macro economic and other factors affecting the stock market in general, expectations of interest rates, investor sentiment towards MLPs or the energy sector, changes in a particular issuer's financial condition, or unfavorable or unanticipated poor performance of a particular issuer (in the case of MLPs, generally measured in terms of distributable cash flow).
